

Lesson 8-4

Example 1 Write an Equation for a Graph

Write an equation for the ellipse shown below.

The length of the major axis is the distance between the points at $(4, 0)$ and $(-4, 0)$. This distance is 8 units.

$$2a = 8$$

$$a = 4$$

Length of major axis = 8.

Divide each side by 2.

The foci are located at $(2\sqrt{3}, 0)$ and $(-2\sqrt{3}, 0)$,

so $c = 2\sqrt{3}$.

$$c^2 = a^2 - b^2$$

$$12 = 16 - b^2$$

$$b^2 = 4$$

Equation relating a , b , and c

$$c = 2\sqrt{3} \text{ and } a = 4$$

Solve for b^2 .

Since the major axis is horizontal, substitute 16

for a^2 and 4 for b^2 in the form $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$. An

equation of the ellipse is $\frac{x^2}{16} + \frac{y^2}{4} = 1$.

Example 2 Write an Equation Given the Lengths of the Axes

Write an equation for the ellipse with endpoints of the major axis at $(0, 5)$ and $(0, -5)$ and the endpoints of the minor axis at $(-2, 0)$ and $(2, 0)$.

The length of the major axis is $5 - (-5)$ or 10 units.

$$2a = 10$$

$$a = 5$$

Length of major axis = 10

Divide each side by 2.

The length of the minor axis is $2 - (-2)$ or 4 units.

$$2b = 4$$

$$b = 2$$

Length of minor axis = 4

Divide each side by 2.

The major axis is vertical, so substitute $a = 5$ and $b = 2$ into the form $\frac{y^2}{a^2} + \frac{x^2}{b^2} = 1$. An equation of the

ellipse is $\frac{y^2}{25} + \frac{x^2}{4} = 1$.

Example 3 Graph an Equation in Standard Form

Find the coordinates of the center and foci and the lengths of the major and minor axes of the

ellipse with equation $\frac{(y-3)^2}{24} + \frac{(x+1)^2}{4} = 1$. Then graph the ellipse.

The center of this ellipse is at $(-1, 3)$.

Since $a^2 = 24$, $a = 2\sqrt{6}$. Since $b^2 = 4$, $b = 2$.

The length of the major axis is $2(2\sqrt{6})$ or $4\sqrt{6}$ units, and the length of the minor axis is $2(2)$ or 4 units. Since the y^2 term has the greater denominator, the major axis is vertical.

$$c^2 = a^2 - b^2$$

$$c^2 = (2\sqrt{6})^2 - 2^2 \text{ or } 20$$

$$c = \sqrt{20} \text{ or } 2\sqrt{5}$$

Equation relating a , b , and c

$$a = 2\sqrt{6}, b = 2$$

Take the square root of each side.

The foci are at $(-1, 3 + 2\sqrt{5})$ and $(-1, 3 - 2\sqrt{5})$.

You can use a calculator to find some approximate values for x and y that satisfy the equation.

x	y
0	-1.2
0	7.2
-2	-1.2
-2	7.2

Graph the vertices, $(-1, 3 + 2\sqrt{6})$, $(-1, 3 - 2\sqrt{6})$, $(-1 - 2, 3)$, and $(-1 + 2, 3)$, and draw the ellipse that passes through them and the other points.

Example 4 Graph an Equation not in Standard Form

Find the coordinates of the center and foci and the lengths of the major and minor axes of the ellipse with equation $4y^2 + 5x^2 - 24y + 20x - 124 = 0$. Then graph the ellipse.

Complete the square for each variable to write this equation in standard form.

$$4y^2 + 5x^2 - 24y + 20x - 124 = 0$$

Original equation

$$4y^2 - 24y + 5x^2 + 20x - 124 = 0$$

Group x - and y -terms.

$$4(y^2 - 6y + \quad) + 5(x^2 + 4x + \quad) = 124 + 4(\quad) + 5(\quad)$$

Complete the squares.

$$4(y - 6y + 9) + 5(x^2 + 4x + 4) = 124 + 4(9) + 5(4) \quad \left(\frac{6}{2}\right)^2 = 9, \quad \left(\frac{4}{2}\right)^2 = 4$$

Write the trinomials as perfect squares.

$$4(y - 3)^2 + 5(x + 2)^2 = 180$$

$$\frac{(y - 3)^2}{45} + \frac{(x + 2)^2}{36} = 1$$

Divide each side by 180.

The center of this ellipse is at $(-2, 3)$ and the foci are at $(-2, 6)$ and $(-2, 0)$. The length of the major axis is $6\sqrt{5}$ units, and the length of the minor axis is 12.
