**Determining Hours of Daylight**

The illustrations show the length of day at every 10° of latitude for the winter and summer solstices in the northern hemisphere. On each figure, begin at the equator, which has daylight hours of 12 hours and 0 minutes, and label every 10 degrees north and south of the equator to the 60° latitude north and south. Mark the final north and south latitude shown 66.5°. From this latitude to the poles, the daylight hours remain the same. Use the figures to help you answer the questions.
